Day16 - 5th May

```
Task

What is load balancer stickiness how to configure ?

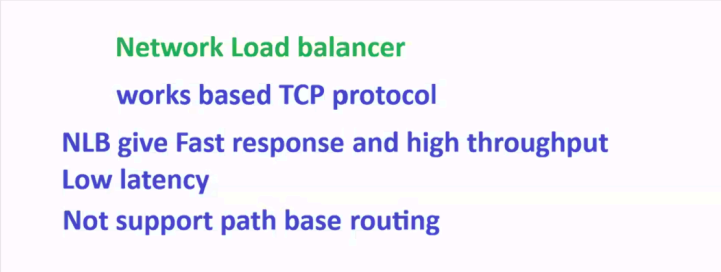
How to ingrate scheduled base scaling (ex: Mng 10:00am servers should create after 11:00am server should be delated)?

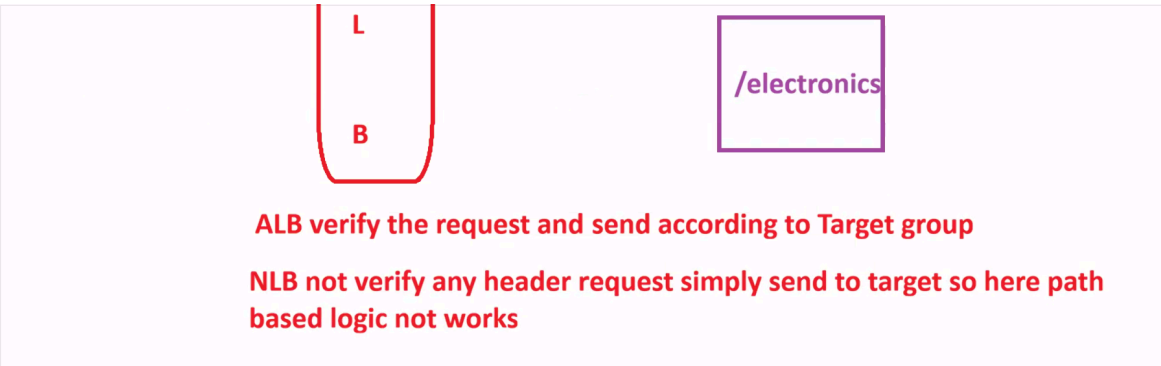
What is lifecycle policy in ASG how to integrate?
```

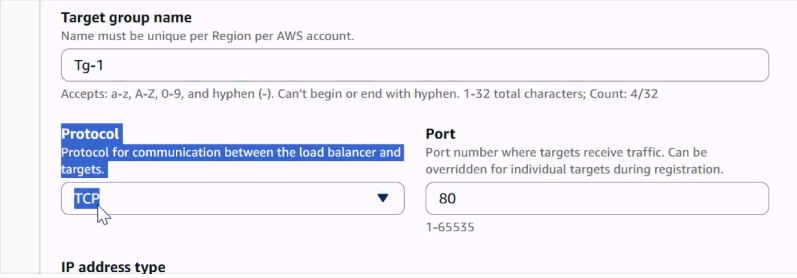
ASG - default warmup period 300 sec.

Network Load Balancer

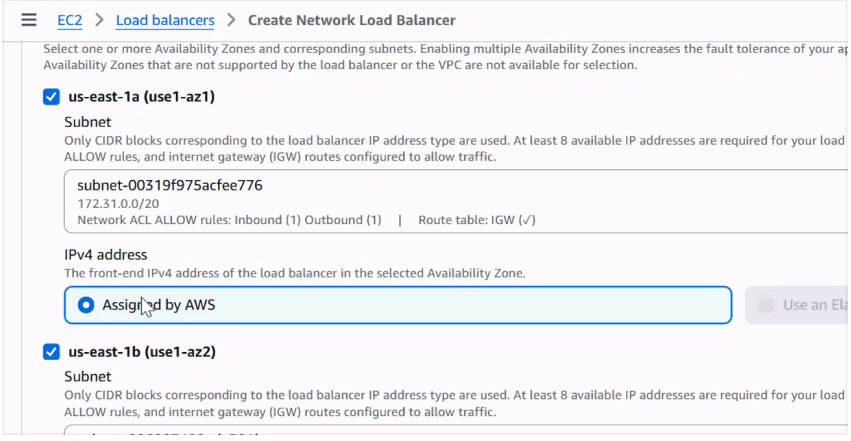
- Worked based on TCP Protocol.







- NO PATH BASED ROUTING, rest same as ALB



✅ Key Benefits

1 Static IP for Whitelisting (Biggest reason)

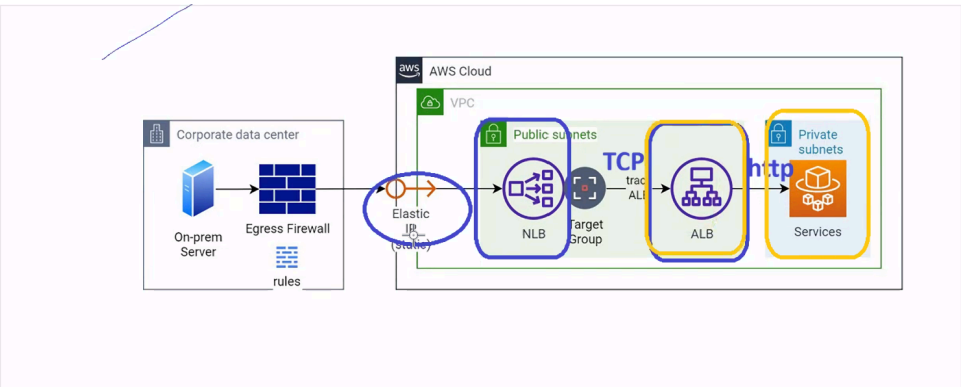
Ask ChatGPT

Many external systems require IP allowlisting:

- Firewalls
- Banks / payment gateways
- Partner APIs

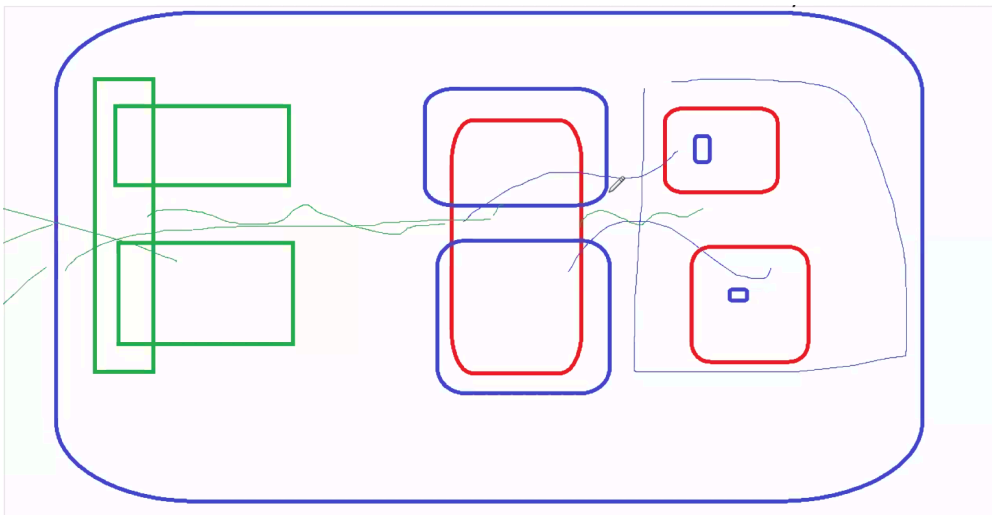
With EIPs:

```
You give fixed IP → they whitelist → done
```



Public NLB->Public TG -> Private ALB-> TG

NLB - TCP - TG - ALB - TG



- High throughput
  - Constant IP

ALB - internal . NLB - external

We need to create NLB with public subnets & ALB with private subnets?

```
